## Setup PyCharm IDE

The chatbot code is developed using the PyCharm IDE community edition. PyCharm allows creating Projects. Each project is a virtual environment in which required libraries can be installed. It also has a PythonTerminal from where the server can be run.

Steps	Purpose
Install libraries using Python Packages tab.	Install following libraries,
	pip install oci
	pip install oracle-ads
	pip install langchain
	pip install chromadb
	pip install faiss-cpu
	pip install streamlit
	pip install python-multipart
	pip install pydantic
	pip install pypdf
Setup the Generative AI service access	Download the private key and config files
	from IAM, User section and copy these to
	.oci folder in your local home directory.
Create Chroma server	Open demo-chroma-create.py and run it.
Running Chroma Server	To run the chroma server use the following
	command from a terminal.
	chroma runpath ./< <path td="" the<="" to=""></path>
	chromadb>>
Running Streamlit application	To run the files that use Streamlit use the
	following command from the terminal,
	streamlit run << name of the file>>

## VM Setup for deploying the Chatbot and test it.

The OU Chatbot can be deployed on the Ubuntu server with 1 OCPUs and 64 GB RAM.

Following steps are followed to setup the environment.

G . In (	G . TD ( 11 G . 1 177 . 22 24 1
Create VM	Create a VM with Canonical Ubuntu 22.04 image,
	VM.Standard.E4.Flex
	Virtual machine, 1 core OCPU, 64 GB memory, 2 Gbps
	network bandwidth.
	Download the ssh key for the VM and save it as ubuntu-
Described IAM reconnectivete	vm-priv.key
Download IAM user private	Download the IAM user private key and config from OCI account to local machine.
key and config file to < <local-path>&gt;/.oci directory</local-path>	account to local machine.
scp to .oci folder using scp.	cen r Leclocal naths /uhuntu ym priv kov elocal
sep to loci folder using sep.	scp -r -l < <local-path>&gt;/ubuntu-vm-priv.key <local-< td=""></local-<></local-path>
	path>/.oci/* ubuntu@ <ip of="" td="" your<=""></ip>
	vm>:/home/ubuntu/.oci/
login into the server	ssh -i ubuntu-vm-priv.key ubuntu@ <ip of="" vm="" your=""></ip>
Create a src folder into the	mkdir src
home directory	exit
(/home/ubuntu)	
Copy code and data files –	scp -r -i / <local-path>/ubuntu-vm-priv.key</local-path>
	/ <local-path>/demo-ou-chatbot-chroma-final.py</local-path>
	ubuntu@ <ip of="" vm="" your="">:/home/ubuntu/src/</ip>
	scp -r -i / <local-path>/ubuntu-vm-priv.key</local-path>
	<local-path> /demo-chroma-create.py</local-path>
	ubuntu@ <ip of="" vm="" your="">:/home/ubuntu/src/</ip>
	scp -r -i / <local-path>/ubuntu-vm-priv.key</local-path>
	<local-path>/pdf-docs/*</local-path>
	ubuntu@ <ip of="" vm="" your="">:/home/ubuntu/src/pdf-</ip>
	docs/
Upgrade Ubuntu packages	sudo apt update && sudo apt upgrade
Install Python	sudo apt update eee sudo apt upgrade sudo apt install python3
Install Virtual Environment	sudo apt install python3-virtualenv
Create a Virtual Environment	virtualenv <name environment="" of="" the=""> (ouenv in this case)</name>
Activate virtual env	source ouenv/bin/activate
Install necessary python	pip install oci
libraries	pip install oracle-ads
	pip install langchain
	pip install chromadb
	pip install faiss-cpu
	pip install streamlit
	pip install python-multipart

	pip install pydantic
	pip install pypdf
Setup the firewall to open	sudo iptables -I INPUT 6 -m statestate NEW -p tcp
ports	dport 8501 -j ACCEPT
Setup subnet security list to	From Compute select your instance,
open port 8501.	Select subnet for your instance
	Select the default security list and add port 8501 for TCP
	traffic.
Index documents	python3 demo-chroma-create.py
Run Chroma server	nohup chroma runpath ./chromadb >> chroma.log &
Run server that will accept	cd src
user input and return response	
	nohup streamlit run demo-ou-chatbot-chroma-final.py &
Test the server	http:// <ip addr="" of="" server="" the="">:8501</ip>
